Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

jeffs.docketing@seedip.com

Office Action Summary

Application No.

10/586,343

Applicant(s)

IWAMA ET AL.

Examiner

ANTHONY S. ADDY

Art Unit

2617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 June 2010.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 2,5,15 and 16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 2,5,15 and 16 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SI.08)
- 4) ☐ Interview Summary (PTO-413)
- 5) ☐ Notice of Interval Patent Application
- 6) ☐ Other: _____
- Paper No(s)/Mail Date _____

DETAILED ACTION

1. This action is in response to applicant's request filed on June 23, 2010 for reconsideration of the finality of the rejection of the last Office action and, therefore, the finality of that action is withdrawn. Prosecution is hereby reopened. New grounds of rejection are set forth below.

Claims 2, 5, 15 and 16 are pending in the present application.

Response to Arguments

2. Applicant's arguments with respect to **claims 2, 5, 15 and 16** have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

4. **Claim 2** is rejected under 35 U.S.C. 103(a) as being unpatentable over **Henry et al., U.S. Patent Number 7,441,043 (hereinafter Henry)** and in view of **Y1, U.S. Patent Number 6,813,715 (hereinafter Y1)** and further in view of **Burton et al., U.S. Patent Number 7,287,269 (hereinafter Burton)**.

Regarding **claim 2**, Henry teaches a mobile wireless terminal apparatus (*e.g., a mobile network access device 200*) in a mobile wireless communication system which has a public network (*e.g., the Internet*), a private network (*e.g., corporate Intranet 218*) and a public wireless LAN system (*e.g., public WLAN 220*) and comprises a virtual private network relay apparatus which establishes an IPsec tunnel (*i.e., the virtual private network relay apparatus reads on the*

secure mobility gateway for establishing a mobile IPsec tunnel when the mobile device 200 is connected to the corporate intranet via the Internet) with a network relay apparatus installed on the private network (e.g., *a gateway identified as GW on the Intranet 218*) via the public network (i.e., *the Internet*), further establishes the IPsec tunnel with the mobile wireless terminal apparatus (i.e., *the network access device 200*) and relays connection of the mobile wireless terminal apparatus (200) from the public wireless LAN system (220) to the private network (218) (see col. 5, lines 29-47, col. 18, lines 40-67 and fig. 2), a home agent that controls moving of the mobile wireless terminal apparatus (see col. 12, lines 17-20), a connection authentication server (e.g., *a centralized authentication server such as a Radius server or AAA*) that is installed on the public wireless LAN system and authenticates connection of the mobile wireless terminal apparatus to the public wireless LAN system, and a wireless LAN access point (e.g., *an AP within public WLAN*) that relays connection authentication procedures of the public wireless LAN performed between the mobile wireless terminal apparatus and the connection authentication server (see col. 7, lines 40-65 and fig. 2) the mobile wireless terminal apparatus comprising:

an authentication processing section that performs authentication processing for connection to the public wireless LAN system and to the connection authentication server (i.e., *the authenticating processing section reads on an IRC client installed on the mobile host 200, since the IRC client is responsible for authenticating the user or the user's computer and creating a secure wireless connection to authenticate the user to a corporate network*) (see col. 5, lines 32-47, col. 10, lines 60-67 and col. 14, lines 44-63); and

an address acquiring section that acquires an IP address of the virtual private network relay apparatus (*e.g., obtaining an IP address of the SMG's public interface IP_{SMG} reads on an IP address of the virtual private network relay apparatus*) when the connection to the public wireless LAN system is permitted (see col. 10, lines 60-67 and col. 17, lines 1-13); and

an IPsec key exchanging section that performs an IPsec key exchange with the virtual private network relay apparatus (*i.e., SMG*) using the IP address of the virtual private network relay apparatus (*i.e., reads on the teaching that the IRC client establishes an IPsec tunnel (IRC-SMG tunnel) between the user computer and the IPsec gateway using IKE (Internet Key Exchange) protocol, wherein the SMG is a special mobile IPsec gateway*) (see col. 9, lines 54-56, col. 11, lines 14-38 and col. 12, lines 3-5, col. 18, lines 40-49).

Henry fails to explicitly teach acquiring an IP address of the virtual private network relay apparatus from the connection authentication server; and an address notifying section that sends an IP address of the mobile wireless terminal apparatus to the virtual private network relay apparatus, via the connection authentication server.

In an analogous field of endeavor, Yi teaches acquiring an IP address of a home gateway (*i.e., reads on a virtual private network relay apparatus*) from an authentication server unit (*i.e., reads on a connection authentication server*); and a user authentication client unit of a remote mobile apparatus (*i.e., reads on a address notifying section*) that sends user information (*i.e., an IP address of the remote apparatus*) to the home gateway, via the authentication server unit (see col. 4, lines 25-57 and col. 5, line 24 through col. 6, line 11).

It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to modify Henry with Yi to include the feature of acquiring an IP address of the virtual

private network relay apparatus from the connection authentication server; and sending an IP address of the mobile wireless terminal apparatus to the virtual private network relay apparatus, via the connection authentication server, in order to establish a virtual network between an authenticated user and an internal network resource that the user wants to use as taught by Yi (see col. 3, lines 1-15).

Henry in view of Yi fails to explicitly wherein the IPsec key exchange is performed by IPsec main mode.

However an IPsec key exchange performed by IPsec main mode is very well known in the art as taught for example by Burton.

In an analogous field of endeavor, Burton teaches an IPsec key exchange is performed by IPsec main mode to allow security peers to authenticate each other and to encrypt data transferred across an unsecured Ethernet using the keys generated from the IKE transactions (see col. 8, lines 13-44 and col. 9, lines 2-11).

It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to modify Henry and Yi with the teachings of Burton to include the feature of performing an IPsec key exchange by IPsec main mode, in order to separate key exchange information from identity and authentication information to protect identity information during an authentication process as taught by Burton (see col. 2, lines 49-65 and col. 9, lines 3-11).

5. **Claims 5, 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Henry et al., U.S. Patent Number 7,441,043 (hereinafter Henry) and in view of Yi, U.S. Patent Number 6,813,715 (hereinafter Yi) and in view of Oyama et al., U.S. Publication**

Number 2006/0185013 A1 (hereinafter Oyama) and further in view of **Burton et al.**, U.S.

Patent Number 7,287,269 (hereinafter Burton).

Regarding **claims 5, 15 and 16**, Henry teaches a mobile wireless terminal apparatus (*e.g.*, *a mobile network access device 200*) in a mobile wireless communication system which has a public network (*e.g.*, *the Internet*), a private network (*e.g.*, *corporate Intranet 218*) and a public wireless LAN system (*e.g.*, *public WLAN 220*) and comprises a virtual private network relay apparatus which establishes an IPsec tunnel (*i.e.*, *the virtual private network relay apparatus reads on the secure mobility gateway for establishing a mobile IPsec tunnel when the mobile device 200 is connected to the corporate intranet via the Internet*) with a network relay apparatus installed on the private network (*e.g.*, *a gateway identified as GW on the Intranet 218*) via the public network (*i.e.*, *the Internet*), further establishes the IPsec tunnel with the mobile wireless terminal apparatus (*i.e.*, *the network access device 200*) and relays connection of the mobile wireless terminal apparatus (*200*) from the public wireless LAN system (*220*) to the private network (*218*) (see col. 5, lines 29-47, col. 18, lines 40-67 and fig. 2), a home agent that controls movement of the mobile wireless terminal apparatus (see col. 12, lines 17-20), a connection authentication server (*e.g.*, *a centralized authentication server such as a Radius server or AAA*) that is installed on the public wireless LAN system and authenticates connection of the mobile wireless terminal apparatus to the public wireless LAN system, and a wireless LAN access point (*e.g.*, *an AP within public WLAN*) that relays connection authentication procedures of the public wireless LAN performed between the mobile wireless terminal apparatus and the connection authentication server (see col. 7, lines 40-65 and fig. 2), the mobile wireless terminal apparatus comprising:

an authentication processing section that performs authentication processing for connection to the public wireless LAN system and to the connection authentication server (*i.e., the authenticating processing section reads on an IRC client installed on the mobile host 200, since the IRC client is responsible for authenticating the user or the user's computer and creating a secure wireless connection to authenticate the user to a corporate network*) (see col. 5, lines 32-47, col. 10, lines 60-67 and col. 14, lines 44-63); and

an address acquiring section that acquires an IP address of the virtual private network relay apparatus (*e.g., obtaining an IP address of the SMG's public interface IP_{SMG} reads on an IP address of the virtual private network relay apparatus*) when the connection to the public wireless LAN system is permitted (see col. 10, lines 60-67 and col. 17, lines 1-13).

Henry fails to explicitly teach acquiring an IP address of the virtual private network relay apparatus from the connection authentication server; and an address notifying section that sends an IP address of the mobile wireless terminal apparatus to the virtual private network relay apparatus, via the connection authentication server.

In an analogous field of endeavor, Yi teaches acquiring an IP address of a home gateway (*i.e., reads on a virtual private network relay apparatus*) from an authentication server unit (*i.e., reads on a connection authentication server*); and a user authentication client unit of a remote mobile apparatus (*i.e., reads on a address notifying section*) that sends user information (*i.e., an IP address of the remote apparatus*) to the home gateway, via the authentication server unit (see col. 4, lines 25-57 and col. 5, line 24 through col. 6, line 11).

It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to modify Henry with Yi to include the feature of acquiring an IP address of the virtual

private network relay apparatus from the connection authentication server; and sending an IP address of the mobile wireless terminal apparatus to the virtual private network relay apparatus, via the connection authentication server, in order to establish a virtual network between an authenticated user and an internal network resource that the user wants to use as taught by Yi (see col. 3, lines 1-15).

Henry in view of Yi fails to explicitly teach an IPsec shared key acquiring section that acquires an IPsec pre-shared secret key from the connection authentication server for use in an IPsec key exchange performed with the virtual private network relay apparatus; an MIP shared key acquiring section that acquires an MIP pre-shared secret key from the connection authentication server for use in mobile IP registration made with the home agent; an IPsec key exchanging section that performs exchange of the IPsec key with the virtual private network relay apparatus using the IPsec pre-shared secret key; and an MIP registering section that initiates the mobile IP registration to the home agent using the MIP pre-shared secret key.

In an analogous field of endeavor, Oyama teaches utilizing an Authorizing, Authentication, Accounting (AAA) server to transfer HMIPv6-related information required for authenticating and authorization a mobile node for HMIPv6 service over the AAA infrastructure (see abstract). For example, Oyama teaches a mobile node (MN) acquires an IPsec shared key for use in an IPsec key exchange performed with a Mobility Anchor Point (MAP) (*i.e., reads on a virtual private network relay apparatus*) from an AAA server (see p. 8 [0115, 0117 & 0119]). Oyama, further teaches the mobile node (MN) acquires a pre-shared secret key for use in mobile IP registration (*i.e., requesting to be authenticated and given MIPv6 service*) made with a home agent (HA) from an AAA server (see p. 8 [0130, 0132 & 0134]).

It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to modify Henry and Yi with the teachings of Oyama to include a mobile wireless terminal apparatus acquiring an IPsec pre-shared secret key for mobile IP registration to a home agent, in order to efficiently transfer information for authenticating and authorizing a mobile node requesting mobile IP related services over an AAA infrastructure to secure pertinent communication as taught by Oyama (see p. 3 [0033, 0035, 0038 & 0060]).

The combination of Henry, Yi and Oyama fails to explicitly teach wherein the IPsec key exchange is performed by IPsec main mode.

However an IPsec key exchange performed by IPsec main mode is very well known in the art as taught for example by Burton.

In an analogous field of endeavor, Burton teaches an IPsec key exchange is performed by IPsec main mode to allow security peers to authenticate each other and to encrypt data transferred across an unsecured Ethernet using the keys generated from the IKE transactions (see col. 8, lines 13-44 and col. 9, lines 2-11).

It would therefore have been obvious to one of ordinary skill in the art at the time of the invention to modify Henry, Yi and Oyama with the teachings of Burton to include the feature of performing an IPsec key exchange by IPsec main mode, in order to separate key exchange information from identity and authentication information to protect identity information during an authentication process as taught by Burton (see col. 2, lines 49-65 and col. 9, lines 3-11).

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Kakemizu et al., U.S. Patent Number 7,068,640 discloses VPN system in mobile IP network and method of setting VPN.

Mukherjee et al., U.S. Patent Number 7,478,427 discloses method and apparatus for providing adaptive VPN to enable different security levels in virtual private networks (VPNS).

Van Ackere et al., U.S. Patent Number 7,624,429 discloses method, a network access server, an authentication –authorization-and-accounting server, and a computer software product for proxying user authentication-authorization-and-accounting messages via a network access server.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to ANTHONY S. ADDY whose telephone number is (571)272-7795. The examiner can normally be reached on Mon-Thur 8:00am-6:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Edouard can be reached on 571-272-7603. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR

system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
